

Experiment No. 4

Aim: To install Kubectl and execute Kubectl commands to manage the Kubernetes cluster and deploy Your First Kubernetes Application.

Steps:**1. Create an EC2 Linux Instances on AWS.**

[EC2](#) > [Instances](#) > Launch an instance

Launch an instance [Info](#)

Amazon EC2 allows you to create virtual machines, or instances, that run on the AWS Cloud. Quickly get started by following the simple steps below.

Name and tags [Info](#)

Name

[Add additional tags](#)

▼ Application and OS Images (Amazon Machine Image) [Info](#)

An AMI is a template that contains the software configuration (operating system, application server, and applications) required to launch your instance. Search or Browse for AMIs if you don't see what you are looking for below

Recents

Quick Start

Amazon Linux

aws

macOS

Ubuntu

ubuntu

Windows

Microsoft

Red Hat

Red Hat

SUSE Li

Browse more AMIs

Including AMIs from

▼ Key pair (login) [Info](#)

You can use a key pair to securely connect to your instance. Ensure that you have access to the selected key pair before you launch the instance.

Key pair name - *required*

[Create new key pair](#)

▼ Network settings [Info](#)

[Edit](#)

Network [Info](#)

vpc-0404d393731afabc3

Subnet [Info](#)

No preference (Default subnet in any availability zone)

Auto-assign public IP [Info](#)

Enable

Additional charges apply when outside of [free tier allowance](#)

Firewall (security groups) [Info](#)

A security group is a set of firewall rules that control the traffic for your instance. Add rules to allow specific traffic to reach your instance.

☒ Create security group

☐ Select existing security group

We'll create a new security group called 'launch-wizard-4' with the following rules:

☒ Allow SSH traffic from

Helps you connect to your instance

Anywhere

0.0.0.0/0

☒ Allow HTTPS traffic from the internet

To set up an endpoint, for example when creating a web server

☒ Allow HTTP traffic from the internet

To set up an endpoint, for example when creating a web server

 Rules with source of 0.0.0.0/0 allow all IP addresses to access your instance. We recommend setting security group rules to allow access from known IP addresses only.

[×](#)

Instances (2) [Info](#)

[Connect](#)[Instance state ▼](#)[Actions ▼](#)[Launch instances](#)

Find instance by attribute or tag (case-sensitive)

[All states ▼](#)[< 1 > ⚙](#)

<input type="checkbox"/>	Name ↗ ▼	Instance ID	Instance state ▼	Instance type ▼	Status check	Alarm status	Availability Zone ▼	Public IP
<input type="checkbox"/>	Nishant Khetal	i-0341f2e761db28a8c	 Running 🔍 🔍	t2.micro	 2/2 checks passed View alarms +	View alarms +	us-east-1c	ec2-54-
<input type="checkbox"/>	Nishant	i-0689f78090ca539a9	 Running 🔍 🔍	t2.micro	 2/2 checks passed View alarms +	View alarms +	us-east-1c	ec2-54-

2. Then click on Id of that instance then click on connect

The screenshot shows the AWS Management Console interface for connecting to an EC2 instance. The breadcrumb trail at the top is 'EC2 > Instances > i-0a57da166d1f22307 > Connect to instance'. The main heading is 'Connect to instance' with an 'Info' link. Below this, a message states: 'Connect to your instance i-0a57da166d1f22307 (nishant) using any of these options'. There are four tabs: 'EC2 Instance Connect' (selected), 'Session Manager', 'SSH client', and 'EC2 serial console'. A yellow warning box contains a triangle icon and text: 'Port 22 (SSH) is open to all IPv4 addresses. Port 22 (SSH) is currently open to all IPv4 addresses, indicated by 0.0.0.0/0 in the inbound rule in your security group. For increased security, consider restricting access to only the EC2 Instance Connect service IP addresses for your Region: 18.206.107.24/29. Learn more.' Below the warning, the 'Instance ID' is 'i-0a57da166d1f22307 (abhinav)'. Under 'Connection Type', there are two options: 'Connect using EC2 Instance Connect' (selected with a radio button) and 'Connect using EC2 Instance Connect Endpoint' (unselected). The selected option has a description: 'Connect using the EC2 Instance Connect browser-based client, with a public IPv4 address.' The 'Public IPv4 address' is '54.165.196.241'. The 'Username' field is 'ec2-user', with a note: 'Enter the username defined in the AMI used to launch the instance. If you didn't define a custom username, use the default username, ec2-user.' At the bottom right are 'Cancel' and 'Connect' buttons.

3. SSH into the created machine instance

- Give permissions to the current user to the downloaded pem file using -
chmod 400 <security_filename.pem>

```
ADMIN@Kheta1 MINGW64 ~ (master)
$ cd Downloads/

ADMIN@Kheta1 MINGW64 ~ (master)
$ chmod 400 "serverkey-01.pem"

ADMIN@Kheta1 MINGW64 ~/Downloads (master)
$ |
```

```
ssh -i (keyname).pem (username)@(public ipv4 dns address)
```

[illegible]

```
❏ sudo yum install docker -y
```

```
[ec2-user@ip-172-31-90-103 ~]$ sudo yum install docker -y

complete!
[ec2-user@ip-172-31-90-103 ~]$

```

- Configure cgroup in a daemon.json

(this can be done by creating the file and using **nano** text editor)

```

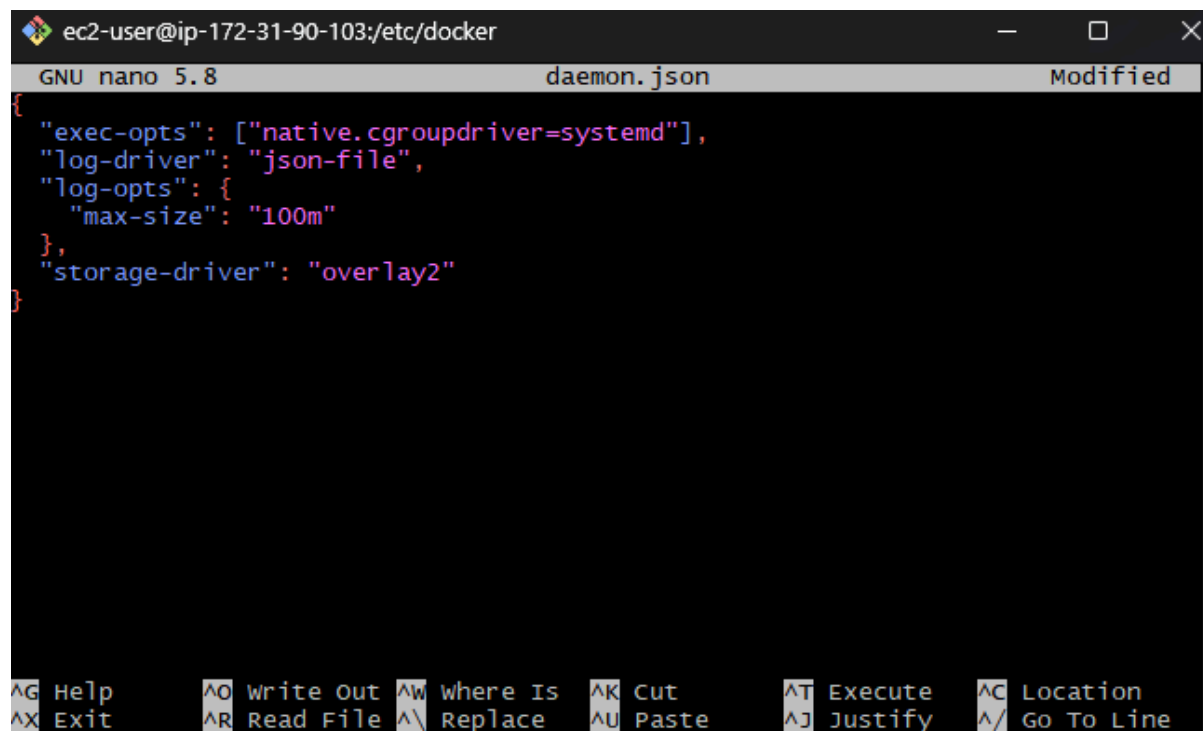

{
  "exec-opts": ["native.cgroupdriver=systemd"],
  "log-driver": "json-file",
  "log-opts": {
    "max-size": "100m"
  },
  "storage-driver": "overlay2"
}

```

```

[ec2-user@ip-172-31-90-103 docker]$ sudo nano daemon.json
[ec2-user@ip-172-31-90-103 docker]$ |

```

The screenshot shows a terminal window with the nano text editor open. The title bar indicates the file is 'daemon.json' and it has been 'Modified'. The editor shows the following JSON content:

```

{
  "exec-opts": ["native.cgroupdriver=systemd"],
  "log-driver": "json-file",
  "log-opts": {
    "max-size": "100m"
  },
  "storage-driver": "overlay2"
}

```

The bottom status bar of the nano editor displays various keyboard shortcuts: ^G Help, ^O Write Out, ^W Where Is, ^K Cut, ^T Execute, ^C Location, ^X Exit, ^R Read File, ^_ Replace, ^U Paste, ^J Justify, and ^_ Go To Line.

- Enable and start docker and also load the daemon.json

```

sudo systemctl enable docker
sudo systemctl daemon-reload
sudo systemctl restart docker

```

```

[ec2-user@ip-172-31-90-103 docker]$ sudo systemctl enable docker
Created symlink /etc/systemd/system/multi-user.target.wants/docker.service -> /usr/lib/systemd/system/docker.service.
[ec2-user@ip-172-31-90-103 docker]$ sudo systemctl daemon-reload
[ec2-user@ip-172-31-90-103 docker]$ sudo systemctl restart docker
[ec2-user@ip-172-31-90-103 docker]$ |

```

- Check if docker is installed

```

[ec2-user@ip-172-31-90-103 docker]$ docker --version
Docker version 25.0.5, build 5dc9bcc
[ec2-user@ip-172-31-90-103 docker]$ |

```

5. Install Kubernetes

- SELinux needs to be disabled before configuring kubelet

sudo setenforce 0

sudo sed -i 's/^SELINUX=enforcing\$/SELINUX=permissive/' /etc/selinux/config

```
[ec2-user@ip-172-31-90-103 docker]$ sudo setenforce 0
sudo sed -i 's/^SELINUX=enforcing$/SELINUX=permissive/' /etc/selinux/config
[ec2-user@ip-172-31-90-103 docker]$ |
```

- Add Kubernetes using the repo

(this is done by creating **kubernetes.repo** file in **/etc/yum.repos.d** and configuring it using **nano** editor)

[kubernetes]

name=Kubernetes

baseurl=https://pkgs.k8s.io/core:/stable:/v1.30/rpm/

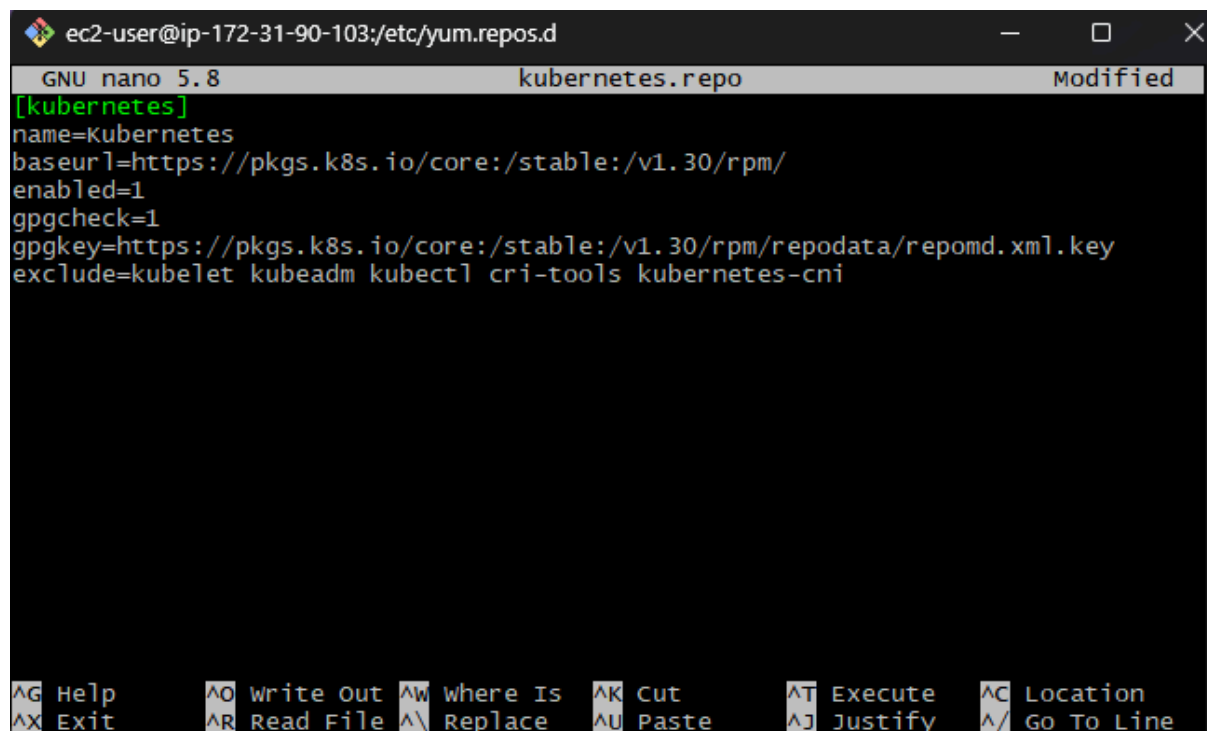

enabled=1

gpgcheck=1

gpgkey=https://pkgs.k8s.io/core:/stable:/v1.30/rpm/repodata/repomd.xml.key

exclude=kubelet kubeadm kubectl cri-tools kubernetes-cni

```
[ec2-user@ip-172-31-90-103 docker]$ cd /etc/yum.repos.d/
[ec2-user@ip-172-31-90-103 yum.repos.d]$ ls
amazonlinux.repo  kernel-livepatch.repo
[ec2-user@ip-172-31-90-103 yum.repos.d]$ sudo nano kubernetes.repo
[ec2-user@ip-172-31-90-103 yum.repos.d]$ ls
amazonlinux.repo  kernel-livepatch.repo  kubernetes.repo
[ec2-user@ip-172-31-90-103 yum.repos.d]$ |
```

```
ec2-user@ip-172-31-90-103:/etc/yum.repos.d
GNU nano 5.8 kubernetes.repo Modified
[kubernetes]
name=Kubernetes
baseurl=https://pkgs.k8s.io/core:/stable:/v1.30/rpm/
enabled=1
gpgcheck=1
gpgkey=https://pkgs.k8s.io/core:/stable:/v1.30/rpm/repodata/repomd.xml.key
exclude=kubelet kubeadm kubectl cri-tools kubernetes-cni

^G Help      ^O Write Out ^W Where Is  ^K Cut       ^T Execute  ^C Location
^X Exit      ^R Read File ^\ Replace  ^U Paste     ^J Justify  ^_ Go To Line
```

- Update packages list using **sudo yum update**

```
[ec2-user@ip-172-31-90-103 yum.repos.d]$ sudo yum update
Kubernetes                               125 kB/s | 17 kB      00:00
Dependencies resolved.
Nothing to do.
Complete!
[ec2-user@ip-172-31-90-103 yum.repos.d]$
```

- Install kubelet kubeadm kubectl

sudo yum install -y kubelet kubeadm kubectl --disableexcludes=kubernetes

```
[ec2-user@ip-172-31-90-103 yum.repos.d]$ sudo yum install -y kubelet kubeadm kubectl --disableexcludes=kubernetes
Last metadata expiration check: 0:00:42 ago on Sat Sep 14 04:08:20 2024.
Dependencies resolved.
```

W0914 04:12:17.711154 27990 checks.go:844] detected that the sandbox image "registry.k8s.io/pause:3.8" of the container runtime is inconsistent with that used by kubeadm. It is recommended to use "registry.k8s.io/pause:3.9" as the CRI sandbox image.
[certs] Using certificateDir folder "/etc/kubernetes/pki"
[certs] Generating "ca" certificate and key
[certs] Generating "apiserver" certificate and key
```

```
Your Kubernetes control-plane has initialized successfully!

To start using your cluster, you need to run the following as a regular user:

  mkdir -p $HOME/.kube
  sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
  sudo chown $(id -u):$(id -g) $HOME/.kube/config

Alternatively, if you are the root user, you can run:

  export KUBECONFIG=/etc/kubernetes/admin.conf

You should now deploy a pod network to the cluster.
Run "kubectl apply -f [podnetwork].yaml" with one of the options listed at:
  https://kubernetes.io/docs/concepts/cluster-administration/addons/

Then you can join any number of worker nodes by running the following on each as root:

kubeadm join 172.31.90.103:6443 --token 0zk8w3.xyegkydsy42vfscm \
--discovery-token-ca-cert-hash sha256:31c672892b19dcb869fc46362d189234128f5bfc302bd41ae8c6078c56173f00
[ec2-user@ip-172-31-90-103 yum.repos.d]$
```

□ Save the token

```
kubeadm join 172.31.90.103:6443 --token 0zk8w3.xyegkydsy42vfscm \
--discovery-token-ca-cert-hash sha256:31c672892b19dcb869fc46362d189234128f5bfc302bd41ae8c6078c56173f00
```

□ Copy the mkdir and chown commands from the top and execute them

`mkdir -p $HOME/.kube`

```
[ec2-user@ip-172-31-90-103 yum.repos.d]$ mkdir -p $HOME/.kube
[ec2-user@ip-172-31-90-103 yum.repos.d]$ |
```

`sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config`

```
[ec2-user@ip-172-31-90-103 yum.repos.d]$ sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
[ec2-user@ip-172-31-90-103 yum.repos.d]$
sudo chown $(id -u):$(id -g) $HOME/.kube/config
```

```
[ec2-user@ip-172-31-90-103 yum.repos.d]$
sudo chown $(id -u):$(id -g) $HOME/.kube/config
[ec2-user@ip-172-31-90-103 yum.repos.d]$
```

- Then, add a common networking plugin called flannel file as mentioned in the code.

kubectl apply -f <https://raw.githubusercontent.com/coreos/flannel/master/Documentation/kube-flannel.yml>

```
[ec2-user@ip-172-31-90-103 yum.repos.d]$ kubectl apply -f https://raw.githubusercontent.com/coreos/flannel/master/Documentation/kube-flannel.yml
namespace/kube-flannel created
clusterrole.rbac.authorization.k8s.io/flannel created
clusterrolebinding.rbac.authorization.k8s.io/flannel created
serviceaccount/flannel created
configmap/kube-flannel-cfg created
daemonset.apps/kube-flannel-ds created
[ec2-user@ip-172-31-90-103 yum.repos.d]$
```

7. Deploy nginx server

- Apply deployment using this following command:

kubectl apply -f <https://k8s.io/examples/pods/simple-pod.yaml>

```
[ec2-user@ip-172-31-90-103 docker]$ kubectl apply -f https://k8s.io/examples/pods/simple-pod.yaml
pod/nginx created
```

- use **kubectl get nodes** to check whether the pod gets created or not

```
[ec2-user@ip-172-31-90-103 docker]$ kubectl get pods
NAME      READY   STATUS    RESTARTS   AGE
nginx     0/1     Pending   0           12s
```

kubectl describe pod nginx (This command will help to describe the pods it gives reason for failure as it shows the untolaterated taints which need to be untainted.)

```
[ec2-user@ip-172-31-90-103 docker]$ kubectl describe pod nginx
Name:      nginx
Namespace: default
Priority:   0
Service Account: default
Node:      <none>
Labels:    <none>
Annotations: <none>
Status:    Pending
IP:        <none>
IPs:       <none>
Containers:
  nginx:
    Image:      nginx:1.14.2
    Port:       80/TCP
    Host Port:  0/TCP
    Environment: <none>
    Mounts:
      /var/run/secrets/kubernetes.io/serviceaccount from kube-api-access-k4lj6 (ro)
      Type:      Projected (a volume that contains injected data from multiple sources)
      TokenExpirationSeconds: 3607
      ConfigMapName: kube-root-ca.crt
      ConfigMapOptional: <nil>
      DownwardAPI: true
    QoS Class:   BestEffort
    Node-Selectors: <none>
    Tolerations: node.kubernetes.io/not-ready:NoExecute op=Exists for 300s
                 node.kubernetes.io/unreachable:NoExecute op=Exists for 300s
Events:
  Type     Reason                  Age    From                      Message
  ----     -
  Warning  FailedScheduling        7s     default-scheduler        0/1 nodes are available: 1 node(s) had untolaterated taint {node-role.kubernetes.io/control-plane: }.
  Warning  PreemptionNotHelpful    7s     default-scheduler        0/1 nodes are available: 1 Preemption is not helpful for scheduling.
```

- check pod status

```
[ec2-user@ip-172-31-90-103 ~]$ kubectl get pods
NAME      READY   STATUS    RESTARTS   AGE
nginx     1/1     Running   1 (6s ago)  90s
[ec2-user@ip-172-31-90-103 ~]$ kubectl port-forward nginx 8081:80
Forwarding from 127.0.0.1:8081 -> 80
Forwarding from [::1]:8081 -> 80
```

8. Verify your deployment

- Open up a new terminal and ssh to your EC2 instance. Then, use this curl command to check if the Nginx server is running. **curl --head http://127.0.0.1:8080** If the response is 200 OK and you can see the Nginx server name, your deployment was successful. We have successfully deployed our Nginx server on our EC2 instance.

```
[ec2-user@172-31-90-103 ~]$ curl --head http://127.0.0.1:8080
HTTP/1.1 200 OK
Server: nginx/1.18.0 (Linux)
Date: Sat, 14 Sep 2024 12:31:53 GMT
Content-Type: text/html
Content-Length: 612
Connection: keep-alive
```

Conclusion:

An AWS EC2 Linux instance was set up, and Docker and Kubernetes were installed. Kubernetes was initialized successfully, and the required commands were executed. Flannel was installed as a networking plugin. Although there was an initial error with the Nginx deployment, it was eventually deployed successfully using the `simple-pod.yml` file and accessed via localhost on port 8080.
