# **Experiment No. 3**

**Aim**: To understand the Kubernetes Cluster Architecture, install and Spin Up a Kubernetes Cluster on Linux Machines/Cloud.

#### Steps:

1. Create 3 EC2 Ubuntu Instances on AWS. (Name 1 as Master, the other 2 as worker-1 and worker-2)

## 2. SSH into all 3 machines

☐ Give permissions to the current user to the downloaded pem file using - chmod 400 <security\_filename.pem>

```
ADMIN@Khetal MINGW64 ~ (master)
$ cd Downloads/

ADMIN@Khetal MINGW64 ~ (master)
$ chmod 400 "serverkey-01.pem"

ADMIN@Khetal MINGW64 ~/Downloads (master)
$ |
```

☐ ssh into all the three machines using —

# ssh -i (keyname).pem (username)@(public ipv4 dns address)

where keyname is name of the key you created. (server-01.pem). Other details can be found on the Instance dashboard.

#### 3. Installation Of Docker on three machines

```
[ec2-user@ip-172-31-90-103 ~]$ sudo yum install docker -y

After installing Kubernetes, we need to configure internet options to allow bridging.

☐ Save the token

☐ Copy the mkdir and chown commands from the top and execute them

#### mkdir -p \$HOME/.kube

```

☐ Then, add a common networking plugin called flammel file as mentioned in the code.

### 6. Perform this ONLY on the worker machines

☐ Paste the below command on all 2 worker machines

sudo yum install iproute-tc -y sudo systemctl enable kubelet sudo systemctl restart kubelet

Now use the token from earlier to join into worker instances

☐ **kubectl get nodes** to check whether master and worker nodes are connected successfully

```
[ec2-user@ip-54-211-147-10 docker]$ kubectl get nodes

```

#### Conclusion:

An EC2 instance was created on AWS Linux, and Docker, Kubernetes, Kubelet, Kubeadm, and Kubectl were installed. Kubernetes was initialized on the master node, which provided a token for connecting the master and worker nodes. On the slave node, iproute was installed, and Kubelet was enabled and restarted. However, there was an issue with joining the slave node to the cluster, resulting in only the master node being listed when running kubectl get nodes
